

SAFEHOUSE SYSTEMS

Entry Control Module

Fast

Less than ten seconds to process a Guest on the List. Hot-Keys eliminate the mouse.

Smart

Detects and repairs file errors on the fly. System rules prevent input errors. Operator performance monitoring and tracking.

Easy

Access Control Officers are processing entries after one shift. A separate administrator program prevents access to sensitive data.

The Entry Controller is the backbone of the SafeHouse line of fully integrated access control software. It is not a Visual basic® product, but rather a true Client-Server program written in 32-bit code. It is also the only product available that uses a database engine as it's foundation. What this means to you is far superior performance, stability, and reliability, whether it's being operated on a single platform or as part of a network. Our files are fully ODBC (Open Database Connectivity) compliant. This means you can freely access your data from a number of other applications, create custom queries, reports and even custom file links. We even include the utility programs required for you to do this.

13 User Classes The full version of the Entry Controller allows you to create user classes ranging from multiple owners, spouses, children, renters, timeshare users, hotel guests, agency users and non-resident members.

User class information is displayed when any resident name is selected. Active cross-referencing provides a visual alert and allows the Access Control Officer to instantly view or select the records of all registered users at any community address.

Power Locates Incrementally search the Resident list by last name, address, phone (area-code overlays supported) or Personal Identification Number . Finds a Resident record using Guest Name, Block and Lot, Building and Apartment, Resident License Plate Value, Parking Decal Number, or Guest name.

Two Operator Alert Messages Each time a Resident is selected, any special resident instructions and any medical alert instructions are predominately displayed on screen. The medical instructions are printable and designed for use by an Emergency Medical Technician.

Six Visitor Classes In addition to the standard One-Time and Repeat Visitor classes, we provide a separate community contractor list and a Resident party or function list. One time visitors can be created for any day up to a week in advance. Repeat visitors can be restricted to date ranges and/or days of the week. Service entries can be restricted to certain hours of certain days. Color coding allows for quick identification of guest class. Recursive indexing allows selection of any or all classes of guests in addition to displaying valid only, or valid and invalid records.

Additional Features Include:

- Automatically recovers from, and corrects, common database file errors “on the fly”.
- Video Link feature captures and displays pictures of the individual Resident or Visitor.
- User configurable aging record erase dates, trim and pack functions.
- Property and Incident reporting system.
- Active and Archive Traffic files, both query-able, supporting wildcard searches.
- A paper backup resident information and guestlist system.
- Four levels of internal password protection.
- Guest turnback tracking.
- NightChecks well-being system capable of alerting a supervisor of a problem.
- Auto-dials resident when required.
- Unlimited length emergency contact and additional resident information.
- Tracks key numbers for emergency response or alarm monitoring.
- Tracks registered vehicles (unlimited number per address).
- Supports multiple direction sets.
- Tracks assigned parking spaces and store rooms.
- Club Mode allows resident and guest use tracking of in-community facilities.
- Double guest processing for condo towers (gate and security desk).

Optional Features:

- **Package Delivery Option.** Allows the access control officer to accept a delivery when the resident is away. Provides telephone and print notification of the resident. Provides tracking and delivery accountability trail.
- **Workorders Option.** Allows you to assign workorders to and track community repair or improvement projects utilizing multiple vendors and project stages.
- **TOPS® Property Management Software Interface Option.** We are the only Access Control software with an approved interface to this extremely popular property management software package. Adds, deletes and updates resident records based on your TOPS databases.
- **Violations Option.** Issue printed violation notices for HOA/POA or other infractions. Full reporting and statistics functions. Can use TOPS® violation categories and new records export to TOPS® violations databases.

Integrated Modules:

- **Direct-Access.** Our WebGuest module allows residents to add names to their guest lists over the web. The module is site configurable so you can set your own rules regarding guest types and future dates. WebGuest is also completely secure. There is no way a hacker can obtain any personal information through the interface, and a record is kept of each connection for complete user accountability. We also offer a traditional voice-mail module.
- **Video Capture.** Captures the output of up to four cameras. Records the guest entry event and indexes a digital image to the traffic log record. Captured images are viewable and printable from the Entry Controller.
- **Gate Control.** Interfaces with a multitude of access control systems. Provides for multiple user classes allowing for date-range/day-of-week/hour-of-day control. Allows the creation of multiple domains (gates within gates). Program all gates from a single interface in the Entry Controller. When controlled exits are used, it provides anti-passback protection and the ability to determine who was in the community between any date and time range.
